

RAM PROMASTER

SLIDING DOOR UPPER STORAGE PANEL

- Do not overstuff the pockets, as protruding objects may scratch the outside of your van when the door is opened.
- Panel can be installed with or without insulation behind the panel. Insulation provides a softer backing but may reduce the storage capacity of the pockets.

What's Included:

Sliding Door Storage Panel

T25 Torx Screws

You Will Need:

Power Drill

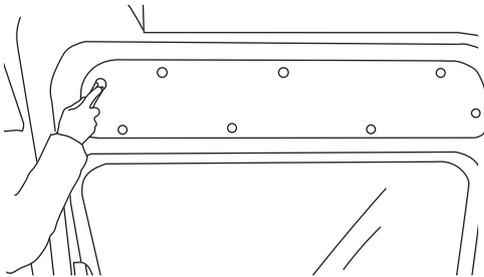

3/32" Steel Drill Bit
with depth stop at 3/8"

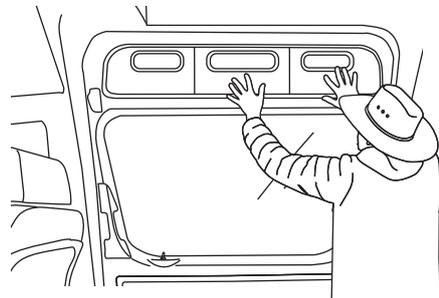

T25 Screwdriver Bit

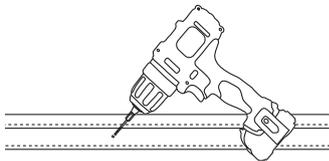

1. If present, remove any plastic stock trim so that your door has the metal frame exposed.

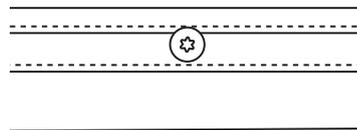

2. The panel is designed to be larger than the indentation in the door. Hold up the panel and center it over the indent.

3. Starting at the center top of the panel, identify a spot between the two outer seams and carefully drill a hole through the panel into the van door.

4. Drive a screw into the hole, securing the panel into place.

5. Repeat this process in the lower middle and in each corner of the panel. Add additional screws as needed until you achieve a secure fit, keeping in mind you may have screws leftover.
